PROFILE

Senior SDET / Quality Engineer with **9 years** across enterprise (Accenture) and crypto (Exodus Movement). I built Exodus's end-to-end automation from zero: five platforms in one CI pipeline, in a domain where a shipped bug can cost users their funds. I put LLMs to work inside QA itself, and I ship AI products solo, so I test AI-era software as someone who builds it. **Available immediately**, remote worldwide.

EXPERIENCE

Exodus Movement

2022 - JUL 2026

SDET / Quality Engineer · Self-custody crypto wallet

- ◆ Built Exodus's end-to-end test automation from zero for a self-custody crypto wallet used by millions, and founded the QA automation team, growing it to four engineers.
- ◆ Shipped LLM-powered QA tooling into production: a Slack agent performing failure analysis on CI runs and auto-filing structured bug reports, and an AI localization evaluator verifying in-app translations across the UI.
- ◆ Automated iOS and Android with Appium and Maestro, and the web app, browser extension and Electron desktop app with Playwright in TypeScript/JavaScript: five platforms headless on GitHub Actions, self-hosted macOS and Linux runners.
- ◆ The suite caught ~85 bugs a month before release and replaced ~12 hours of manual testing daily, gating every release.
- ◆ Tested wallet, swap and exchange APIs covering ~80 crypto assets daily, intercepting and mocking traffic with Charles Proxy to validate transaction, pricing and network-failure flows.
- ◆ Owned bug triage, test plans, regression strategy and **release sign-off** across all five platforms: the final quality gate on software securing real user funds.

Accenture

2017-2022

QA Engineer · Test Automation

- ◆ Built and maintained Selenium page-object regression frameworks integrated into CI for large enterprise client systems.
- ◆ Designed test plans and drove regression strategy across large, multi-team codebases in Agile enterprise delivery.
